Removing the middlemen from communications

Securing privacy is all about paying attention to the details.

For your smartphone to be of any use at all, it has to connect to a mobile network. This is obvious. But the detail many people overlook is that mobile operators are an always present party in the communication process – a party that has your name and personal details, your handset's ID, and elevated access to all messages going through its network.

Always mindful of our users' privacy, we at Crypto Cloud have cut out this middleman from the process. CryptoOne comes with a special multi-IMSI SIM card issued by us. Every handset is ready to use out-of-the-box, without you having to fill in any paperwork to subscribe for access to an operator's network.

Crypto Cloud is your operator. And all we care about is your privacy.

Always stay connected

When you sign up for a mobile operator's services, they give you a Subscriber Identity Module (SIM) card. It contains the rules governing how your handset connects to the network, as well as its International Mobile Subscriber Identity (IMSI). Consumer-grade SIMs have a single IMSI because they are linked by only one network – that of the operator.

Crypto Cloud SIM comes with 16 different IMSI numbers. This gives you access to over 440 networks of different operators worldwide.

Constant connection

Each IMSI is linked with one home network. If you are using a single-SIM card and walk into an area where your provider has a coverage black spot, your device will not be able to connect – even if there are networks of other providers offering coverage. Crypto Cloud SIM can just switch IMSIs and give you access to the other company's network. This

guarantees you will always have coverage.

Roam everywhere

When you are outside your country and rely on roaming, every signal or message you send is transmitted from the device through a foreign network, to your home one, and then to the recipient. With a regular SIM, if the roaming network has a fault, the information will get lost. With Crypto Cloud SIM, your connection route will be steered through an alternate home network (different IMSI).

Extra security benefits

Crypto Cloud is a company founded on the idea to guarantee people's privacy by securing their communications. This is why we strive to offer more than just maximum connectivity. We have also embedded extra features into the Crypto Cloud SIM to protect you and your correspondence.

Built-in VPN

When you use Crypto Cloud SIM to connect to a 2G, 3G or 4G network, all your traffic is always protected by VPN. This means that every communication you send goes through an encrypted tunnel before it gets to the recipient. Separately, all the communication apps we provide use end-to-end encryption for chats, emails and VoIP calls. VPN adds a layer of security on top of that.

SS7 protection

Our SIM cards come with a built-in SS7 firewall that safeguards subscribers' information and guarantees the availability of our service. Thanks to this protection, we can filter a sufficient amount of SS7 messages and inspect signaling traffic in real time. This allows us to block malicious parties from locating our users, hijacking their communication or disrupting our service.

Global coverage, no extra fees

Crypto Cloud SIM offers unlimited data coverage across the globe. You can carry your secure communications device across borders and stay connected with your contacts, without having to pay extra roaming or other fees.

Crypto Cloud SIM has coverage in the following countries:
